Imaging Techniques in CAS 24/7

Why TCD ?

Stroke box on ER of CAS

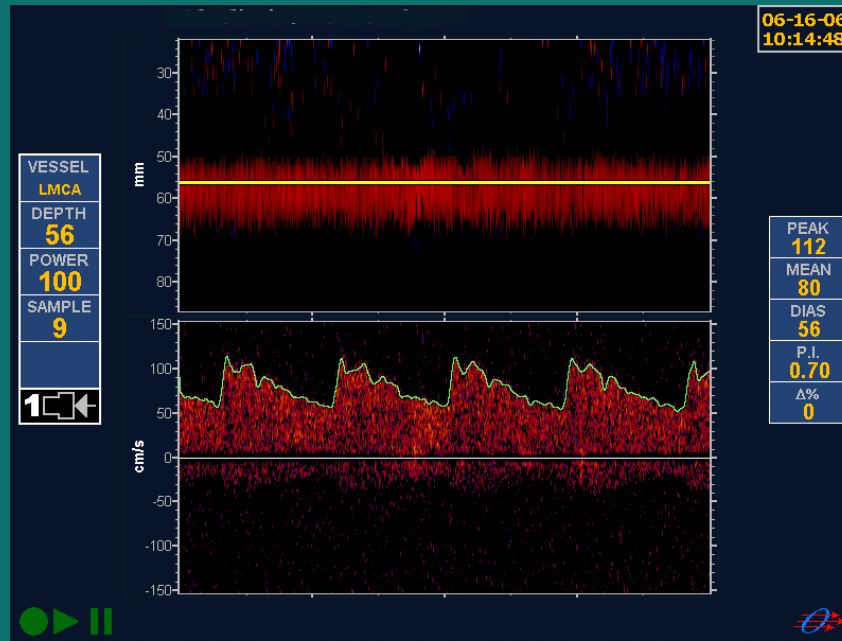

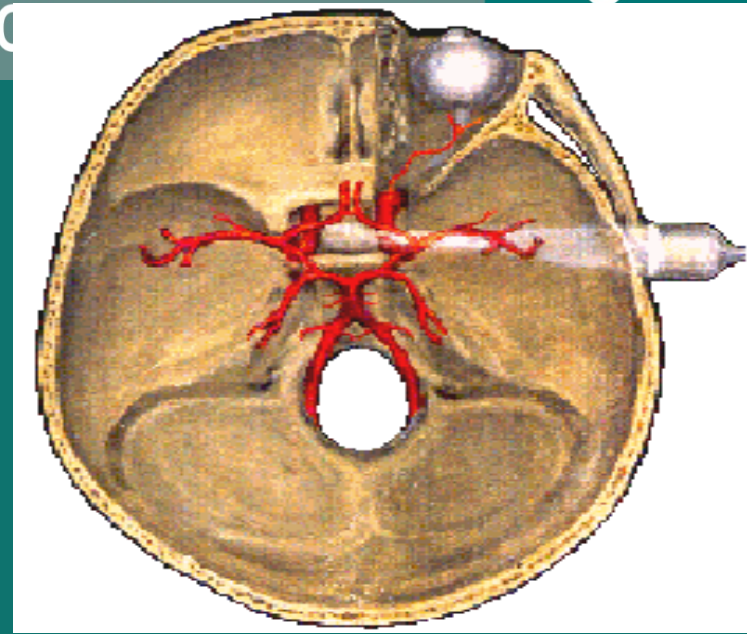

Special Care Unit, CAS

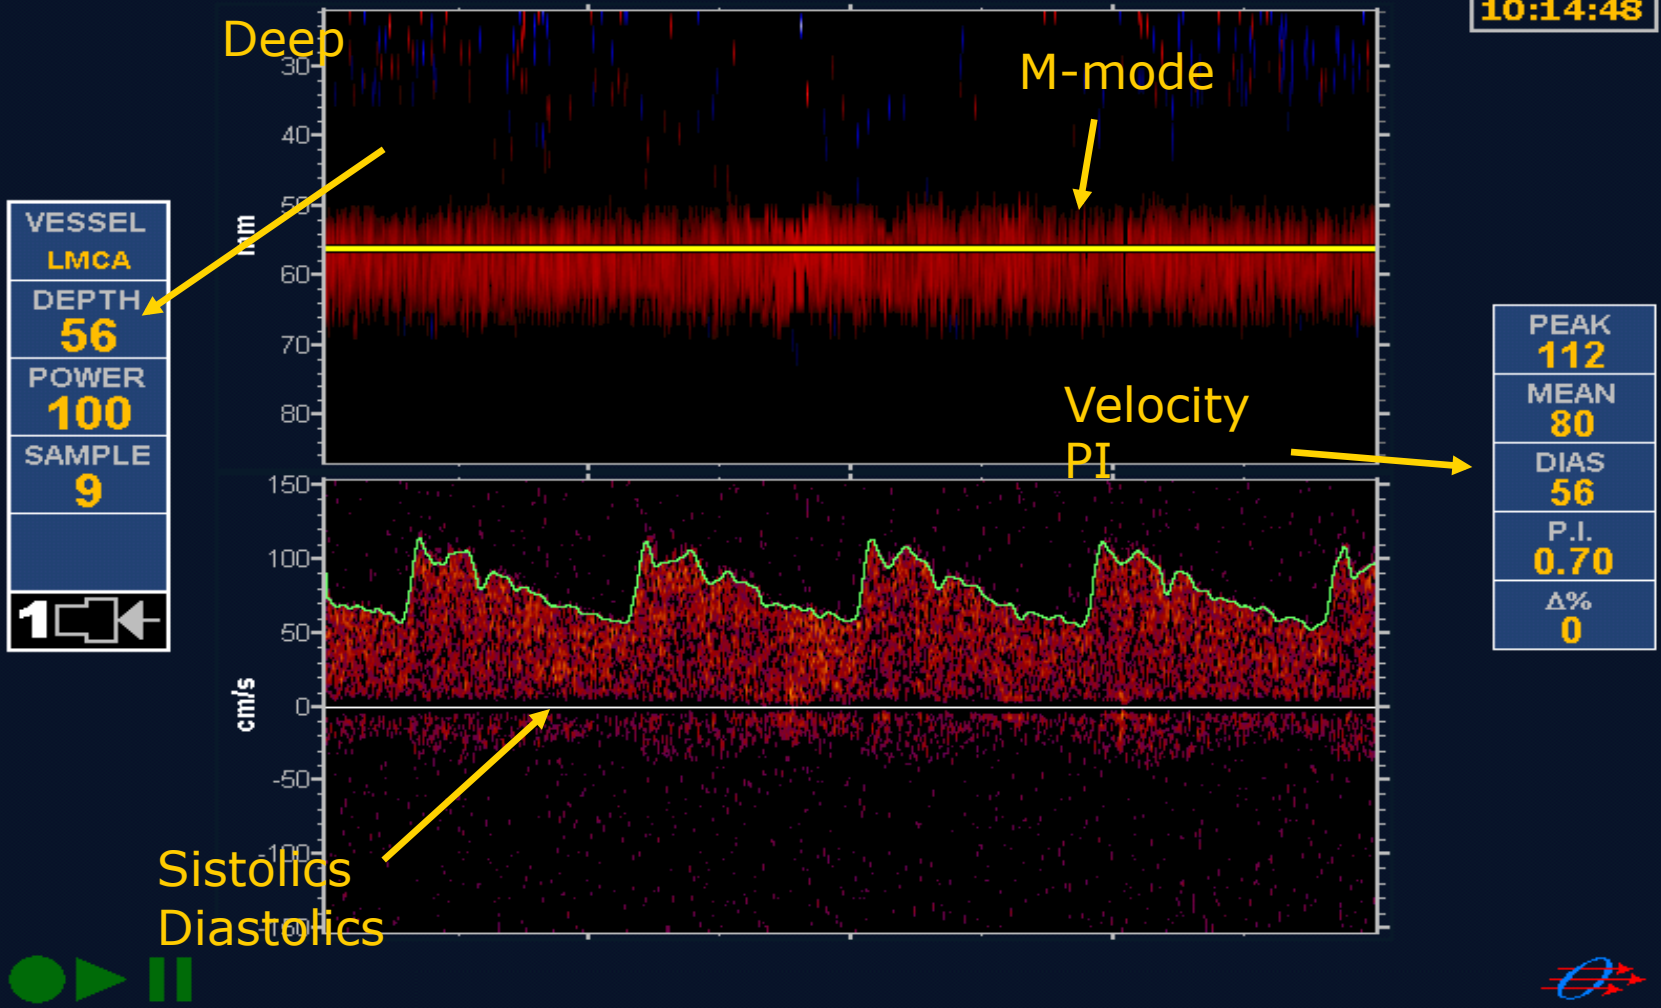

Why?

What do we see with TCD??

06-16-06
10:14:48

TCD is a useful tool

- Stroke (ischemic)
- Brain trauma
- Brain death
- Subarachnoidal hemorrhage
- Other

Acreditada por
Joint Commission International

Alemana[®]
CLINICA

TCD and ischemic stroke

Acreditada por
Joint Commission International

Ischemic stroke with vessel occlusion

- Responds less to EV rt_PA
- Worse prognosis
- Frequent worsening in the following hours

Acreditada por
Joint Commission International

Advantages of TCD

- ✓ Low cost
- ✓ Does not irradiate
- ✓ Bedside test
- ✓ Its performed by the clinician
- ✓ Can be repeted as necessary
- ✓ Allows monitoring
- ✓ **Good correlation with DSA y CTA**

Site of oclusión	Sensibility	Specificity	VPP	VPN
MCA	93	98	93	98
Distal ICA	81	96	81	96
Proximal ICA	94	97	94	97
Basilar oclusion	60	96	60	96
Vertebral oclusion	55	96	71	92

Acreditada por
Joint Commission International

TCD Advantages

Sensitivity, specificity and LHR of TCD compared with CTA, Clínica Alemana de Santiago

Table 2. PLRs, NLRs, Sensitivities, Specificities, and Diagnostic Accuracy for Each Artery With Corresponding 95% CIs

Artery	PLR (95% CI)	NLR (95% CI)	Se (95% CI)	Sp (95% CI)	Diagnostic Accuracy
Any specific artery	13.7 (5.2–35.9)	0.19 (0.09–0.4)	81.8 (68.7–95.0)	94 (88.3–99.7)	90
MCA	24.6 (8.1–74.7)	0.045 (0.006–0.30)	95.6 (87.3–100)	96.2 (91.7–100)	96
Anterior circulation	18.5 (7.1–48)	0 (0–NA)	100 (100–100)	94.5 (89.4–99.7)	96
Posterior circulation	>1000 (NA–infinity)	0.42 (0.18–1)	57.1 (20.4–93.8)	100 (100–100)	97
Central occlusion	70.3 (10–494.8)	0.08 (0.02–0.3)	91.3 (79.7–100)	98.2 (96.1–100)	97
Any overall artery	15.2 (5.8–38.6)	0.09 (0.03–0.28)	90.9 (81.1–100)	94 (88.3–99.7)	93

TIBI 3

52% of complete
reperfusion at 2 hours

TCD advantages

- 79 patients
- Evaluated in the first 24 hours
 - Brain TC
 - Brain CTA
 - DWI
 - TCD blind

Table 2. Additional information given by TCD on 28 patients

Additional information	
Collateral flow	15 (18.9)
Active microembolism	6 (7.6)
Confirms doubtful CTA in patient with MCA trifurcation	3 (3.8)
Confirms occluded MCA M2 branch	n = 2
Discards occluded MCA M2 branch	n = 1
Detects occlusion first not seen by CTA	2 (2.5)
Subclavian steal	1 (1.3)
Information related to patency of vessels	5 (6.3)
Detects proximal carotid stenosis	2 (2.5)

Data shown as number of patients with percent in parentheses.

Additional information

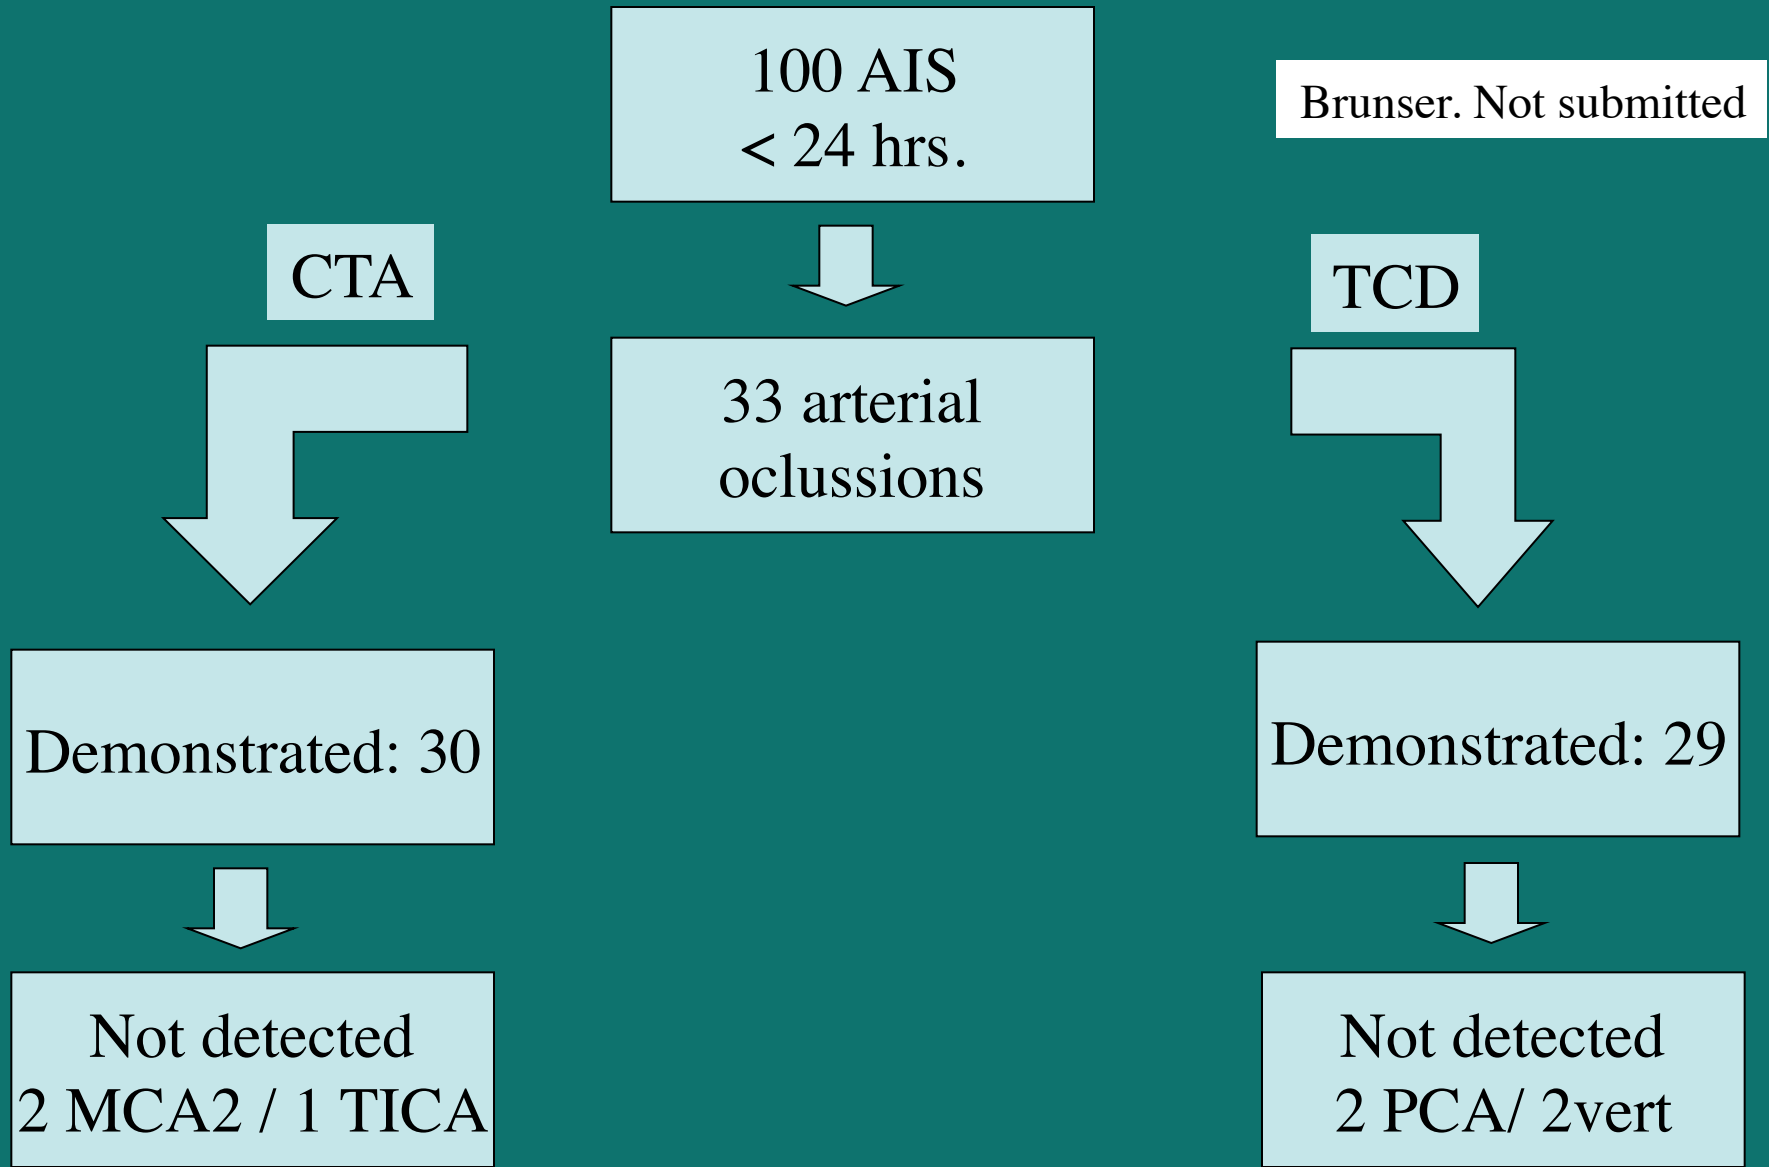

35%

(95% IC 25,7-46,4)

Change in medical management

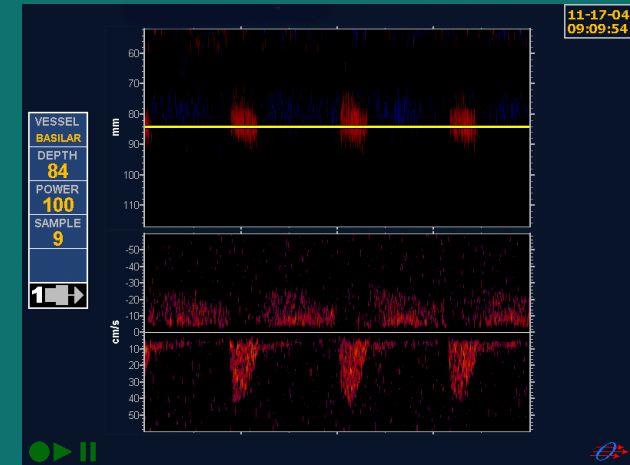

9% (95% CI 4.3–17.1)

TCD and CTA do complement each other

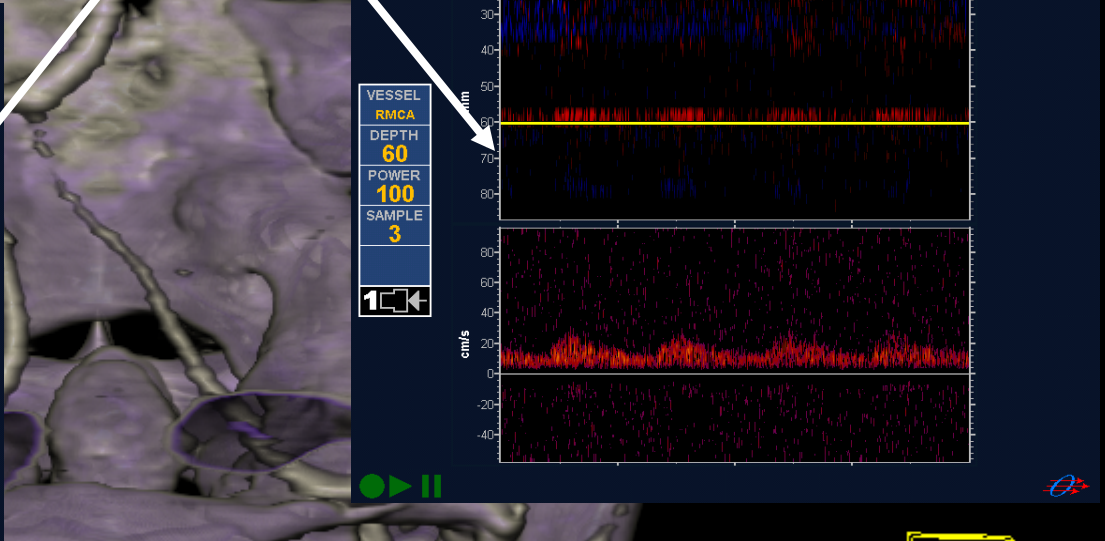

Additional Information

- Ischemic stroke NIHSS 3, frequent fluctuation of symptoms.

NIHSS: 18

P

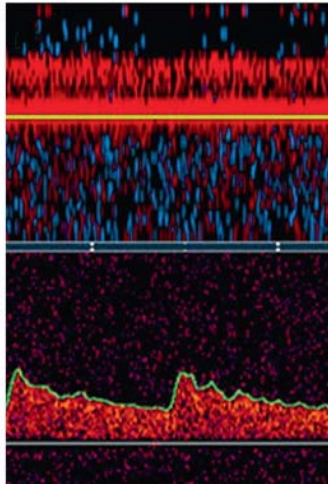

Changes in management caused by TCD in 79 patients with AIS

8.8%, 95% CI 4.3–17.1

Case	Sex age, years	NIHSS	ASIP findings	TCD findings	Change in management	mRS 3 months after stroke
11	F 18	9	left stroke MCA occlusion	left MCA occlusion, with no recanalization during i.v. rt-PA	DSA angiography and intra-arterial thrombolysis were performed, with recanalization of the occluded artery	0
12	F 84	14	right stroke MCA occlusion	right MCA occlusion that recanalized during diagnostic TCD; NIHSS score decreased from 15 to 4	planned DSA and intra-arterial thrombolysis were not performed	1
33	M 66	13	right stroke MCA M2 occlusion	right M2 occlusion, with important collateral flow from ipsilateral ACA and PCA	aggressive neurocritical care was started	1
40	M 66	19	left stroke MCA occlusion	left MCA occlusion, with no recanalization during i.v. rt-PA	DSA and intra-arterial thrombolysis were performed, with recanalization of the artery	0
51	F 69	15	left MCA stroke no occlusion on circle of Willis	post-stenotic left MCA flow signal and inverted ophthalmic artery suggest proximal left carotid artery disease	DSA was performed and ICA stenosis was found; intensive secondary prevention was begun	1
67	M 83	11	left stroke, CTA with important movement artifacts, possible left terminal M1 stenosis	normal TCD	planned diagnostic DSA was not performed	1
75	F 66	10	right MCA stroke no occlusion on circle of Willis	post-stenotic right MCA flow signal and inverted ophthalmic artery suggest proximal right carotid artery disease	DSA was performed and ICA stenosis was found; intensive secondary prevention was begun	0

Rescue of patients in whom rt-PA failed

NIHSS: 9

What about the hot spot: time < 4.5 hours

- 86 patients
- Evaluated in the first 4.5 hours
 - Brain TC
 - CTA brain and cervical
 - DWI
 - TCD not blinde

Additional information

56.9.4% (95 CI 46.4 -66.9)

Change in medical management

17.4%(95 CI. 9.4-25.5)

Beginning of r-tpA
