**Background:** The neutrophil to lymphocyte ratio (NLR), representing change in inflammatory cell subpopulation, is closely linked to mortality in patients with cardiovascular disease. The prognostic role of NLR in patients with ischemic stroke remains unclear.

**Objective:** We investigated whether NLR was associated with early clinical outcome in patients with acute ischemic stroke.

**Patients and methods:** We collected data of patients with the first-ever acute ischemic stroke within 72 h of onset who were admitted to Royal North Shore Hospital from January 2009 to March 2013. White blood cell counts and peripheral differential counts were measured on admission. Early clinical outcomes were disability at discharge and in-hospital mortality assessed by the modified Rankin scale (mRS). We have obtained local Institutional Review Board approval.

**Results:** Among 1131 patients, 454 patients were included and classified into tertile groups based on NLR on admission. Patients in higher tertiles of NLR were likely to have severe neurologic deficit. Higher NLR tertiles were associated with a significant worse shift in the distribution of mRS scores in the ordinal logistic regression analysis (p < 0.0001 for trend). This association remained significant after adjustment for clinical and laboratory variables including age, sex, hypertension, smoking, stroke severity, and glucose level (p = 0.009 for trend). However, risk of death or major disability (score of 3–6 mRS) and in-hospital mortality were not different according to NLR tertiles.

**Conclusion:** In patients with acute ischemic stroke, NLR on admission could be used to predict the short-term functional outcome.

Recanalization of chronic neurovascular arterial occlusion with acute clinical deterioration: Endovascular treatment and clinical outcome
M. Aguilar-Perez\(^a\), W. Kurre\(^a\), R. Martinez\(^a\), C. Klötzsche\(^b\), H. Bäzner\(^c\), H. Henkes\(^d\).
\(^a\)Neuroradiology, Katharinenhospital Klinikum Stuttgart, Stuttgart, Germany; \(^b\)Neurology, Klinikum Schmieder, Allensbach, Germany; \(^c\)Neurology, Bürgerhospital Klinikum Stuttgart, Stuttgart, Germany

**Purpose:** To evaluate the indications for and results of the endovascular reconstruction of extra- and intracranial arteries after subacute and chronic occlusion.

**Methods and materials:** A retrospective analysis of clinical and angiographic data of 35 patients who underwent this treatment was performed. All endovascular procedures were carried out under general
anaesthesia with dual platelet inhibition. An individual combination of balloon angioplasty and stent deployment was used.

**Results:** A total of 35 patients and 36 occlusions treated between 2007 and 2014 were evaluated. Treatment indications were acute clinical symptoms in 21/35 (60%) patients. Target vessels were ICA (n = 5), MCA (n = 2), VA (n = 13), BA (n = 7) or a combination thereof (n = 9). The attempted vessel reconstruction was achieved in 32/36 (88.8%) procedures. Clinical improvement was confirmed in 30 patients (83.3%), two of them despite failed attempt. At follow-up, permanent neurological deficit was encountered in 16 patients. Four patients died, one as a consequence to the procedure.

**Conclusion:** Haemodynamic compromise of the dependent circulation is a possible reason for the endovascular reconstruction of extra- and intracranial vessels in the status of subacute or chronic occlusion. The procedure can be quite demanding (e.g., for basilar and MCA reconstruction). Long-term dual anti-aggregation, angiographic follow-up and treatment of in-stent re-stenoses are part of the concept. Clinical results reach from considerable improvement to major morbidity and procedural mortality.

**Temporal trends of intravenous thrombolysis in acute ischemic stroke patients at a tertiary care center in northern India**

D. Khurana, B. Das, N. Khandelwal, A. Kumar, V. Lal, S. Prabhakaran, 1Neurology, Postgraduate Institute of Medical Education and Research, Chandigarh, India; 2Radiodiagnosis, Postgraduate Institute of Medical Education and Research, Chandigarh, India

**Background:** Acute ischemic stroke (AIS) is chiefly time dependent treatable cause of morbidity and mortality. Despite increasing stroke thrombolysis rates have not been documented.

**Aims:** To determine trends in patient characteristics and rates of tPA use in AIS patients at a tertiary care center in northern India.

**Methods:** All AIS patients presenting within 8 h of symptoms onset from 2010–2014 were enrolled from hospital stroke registry and analyzed for various measures of IV thrombolysis.

**Results:** 608 AIS patients presented within 8 h of symptoms onset. Out of 608 patients, 157 (25.82%) patients received intravenous thrombolysis (IVT) with r-tPA. Patient’s onset-to-door time was ≤2 h in 58.60%, ≤3 h in 25.48% and ≤4.5 h in 15.29%. A substantial change in onset-to-door time and IVT was seen over 4 years. IVT rates in ≤ 2 h of symptom onset increased from 22.2% to 25% and in ≤ 3 h increased from 38.8% to 43.75%. Door-to-CT time (median 25 versus 14 min, P = 0.027) and door-to-needle time (median 75 versus 62 min, P = 0.011) improved, with 64.5% of tPA-treated patients getting imaged ≤ 25 min after arrival. Post IVT, hemorrhage was noticed in 17 (10.82%) patients. Median NIHSS at presentation was 12 while favorable mRS (0–2) at 3 months was seen in 48.85%.

**Conclusions:** Encouraging trends of increasing rates of IV tPA use along with improving quality in thrombolysis over the years is seen in a public sector hospital. This may be indicative of increasing use of IV tPA in developing countries like India.

**Cerebrolysin and recovery after stroke (CARS 2): a randomized, placebo-controlled, double-blind, multicenter clinical study**

A. Guekht, D. Heiss, E. Gusev, J. Vester, D. Doppler, D. Muresanu.

1Neuropsychiatry, Moscow Research and Clinical Center for Neuropsychiatry, Moscow, Russia; 2Neurology, Max Planck Institute for Neurological Research, Cologne, Germany; 3Neurology Neurosurgery and Genetics, Russian National Research Medical University, Moscow, Russia; 4Data Analysis and Study Planning, IDV Data Analysis and Study Planning, Kaiiling, Germany; 5ReD, EVER Neuro Pharma GmbH, Unterach, Austria; 6Medicine and Pharmacy, Iuliu Hatieganu University of Medicine and Pharmacy, Cluj-Napoca, Romania

**Background:** Cerebrolysin was successful in experimental models of cerebral ischemia and showed beneficial effects in clinical trials in acute stroke; a significant persistent effect was demonstrated in one large prospective, randomized, double-blind multicenter study (CARS 1).

**Objective:** To analyze the efficacy and safety of Cerebrolysin in recovery after stroke in the large prospective, randomized, double-blind, placebo-controlled, multicenter and parallel-group trial; study design was similar to CARS 1.

**Patients and methods:** The study compared the effects of 30 ml Cerebrolysin versus placebo during early rehabilitation after stroke. Primary endpoint was the action research arm test (ARAT) score on day 90. Secondary, gait velocity, fine motor function, global neurological status, disability, quality of life, neglect, and depression were evaluated.

**Results:** 240 (120 vs. 120) patients were screened, enrolled, randomized, and treated in 15 study centers in Russia. 231 (114 vs. 117) patients completed the study period; only 9 patients discontinued the study prematurely.

Neither the primary ARAT score nor the secondary outcome measures showed a significant treatment difference on day 90; as the mild baseline levels of impairment resulted in good recovery after 90 days also in the placebo.

Evaluation of vital signs and the global assessment of tolerability did not reveal clinically relevant changes both in the study course and between the treatment groups. Laboratory tests and vital signs did not show any abnormalities.

**Conclusion:** This study did not confirm the findings of the study CARS 1, which showed a large effect size of Cerebrolysin as compared to Placebo. Cerebrolysin was well tolerated.

**Stroke 2**

**Perception on stroke risk factors and warning symptoms among the stroke survivors and recurrence**

1Neurology, Burdwan Medical College, Burdwan, India; 2General Medicine, Midnapore Medical College, Midnapore, India

**Background:** Poor perception on stroke risk factors, warning symptoms, lack of continuity of secondary preventive measures is important etiological factors for recurrence of stroke.

**Objective:** The study aimed to search the inter-relationship between perception of stroke among stroke survivors and related recurrence.

**Patients and methods:** 1560 stroke survivors [M = 900, 59 ± 2 years; F = 640, 58 ± 2 years; ischemic 882 (57.27%); hemorrhagic 658...
(42.73%) were followed up at 8 weeks intervals for 1 year and enquired on educational tires, economical status, types of stroke, disability status and stroke risk factors. Perception on stroke was acquainted with relation to naming the organ involvement, risk factors; warning symptoms presented by the patient and need for continuing secondary preventive treatment.

**Results:** Poor perception on stroke in respect to organ involvement, risk factors, warning symptoms, preventive measures, and socio-economic status were responsible for discontinuity of secondary preventive treatment \((P < 0.001)\). Discontinued patients had poor control of risk factors in relation to hypertension, diabetes, hyperlipidemia, smoking, alcoholism, peripheral or cardio-vascular disorder and low hemoglobin level \((P < 0.001)\). Significant relationship have been observed between discontinuation of secondary preventive treatment and enhancement of disability, recurrence and mortality \((P < 0.001)\).

**Conclusion:** Knowledge on stroke, risk factors, warning symptoms, preventive aspects are to be strengthened globally to reduce recurrence of rate, disability status, mortality and forecasting preventive measures through different mass media and to be intimated to national and international health planning authority for better outcome of stroke patient are preventive measures.

**Stroke 2**

**Low social support and risk of arterial hypertension and stroke in female population aged 25–64 years in Russia: Population-based MONICA-psychosocial study**

V. Gafarov, D. Panov, E. Gromova, I. Gagulin, A. Gafarova. **Collaborative Laboratory of Cardiovascular Diseases Epidemiology, FSBI Institute of Internal and Preventive Medicine, Novosibirsk, Russia**

**Objective:** To explore the influence of social support (SS) on relative risk of an arterial hypertension (AH) and stroke in female population over 16 years in Russia.

**Material and methods:** Under the third screening of the WHO “MONICA-psychosocial” program random representative sample of women aged 25–64 y \((n = 870)\) were surveyed in Novosibirsk. Berkman–Syme test was used to measure indices of close contacts \((I CC)\) and social network \((S NI)\). From 1995 to 2010 women were followed for 16 y for AH and stroke incidence.

**Results:** The prevalence of low SS in women aged 25–64 y was 57% and 77.7% for low ICC and low SNI, respectively.

HR of AH over the first 5 years was 2.01-fold higher \((95.0\% \text{ CI: } 1.025–3.938; p < 0.05)\) in women with low ICC compared to those with higher levels of ICC. Over 10 y HR was 1.93 \((95.0\% \text{ CI: } 1.138–3.261; p < 0.05)\) and it was 1.42 \((95.0\% \text{ CI: } 1.138–3.261; p < 0.05)\) over 16 y follow-up in persons with low ICC. HR of AH in women with low SNI were 1.88 \((p < 0.05)\) and 1.58 \((p < 0.01)\) for 10 and 16 years, respectively. Risk of stroke over 16 y of follow-up was 4.1 \((p < 0.05)\) in women with low ICC, and 2.7 \((p < 0.05)\) in those with low SNI compared women with higher SS levels. Manual workers and married ones with low ICC and SNI had higher rates of AH stroke \((p \text{ for all } < 0.05)\).

**Conclusion:** There is high prevalence of low SS in Russian women aged 25–64 y. Low SS significantly increases risks of AH and stroke especially in married women in manual occupational class.
